

JUMP IN JACK

JiJ Bot

User Setup Guide

Everything you need to install, fund, and run the automated grid + DCA trading bot for JiJ token on Solana.

What is JiJ Bot?

JiJ Bot is an automated trading bot built specifically for the Jump In Jack (JiJ) token on the Solana blockchain. It runs 24/7 on your Android phone and executes buy and sell orders automatically — no manual trading required.

Grid Bot

A grid bot places a ladder of buy orders below the current price and sell orders above it. When price moves down it buys JiJ; when price moves back up it sells for a profit. This cycle repeats continuously, harvesting profit from price oscillation regardless of which direction the market moves overall.

- 20 grid levels total — 10 buy orders below entry price, 10 sell orders above
- Range spans $\pm 40\%$ from your entry price
- Each level is funded equally from your committed SOL
- Profits are auto-compounded back into the grid

DCA (Dollar Cost Averaging)

In addition to grid trading, the bot runs a daily DCA buy using profits from the grid. You set a maximum daily USD limit. The bot picks a random time each day and buys JiJ — averaging your cost basis down over time without touching your committed SOL.

- DCA uses grid profits only — your principal SOL is never at risk from DCA
- You control the daily limit (e.g. \$10, \$25, \$50)
- Can be switched ON, OFF, or Deactivated at any time from the dashboard

Seed Buy (70/30 Protocol)

When the bot starts, it automatically splits your committed SOL: 30% is used for an immediate buy of JiJ (so you have tokens to sell at higher prices right away), and 70% is reserved to fund the 10 buy orders in the grid below current price.

What the bot does NOT do

- It does not send your funds anywhere — all trades stay within your bot wallet
- It does not share any data with third parties
- It does not require an internet-connected server — your phone IS the bot
- It does not trade any token other than JiJ/SOL

Security

JiJ Bot generates a unique Solana wallet directly on your device. This wallet signs all trades automatically — you never have to approve individual transactions. Here is how your funds are protected:

1. Local Hot Wallet — Your Keys, Your Phone

A Solana keypair (private key + public address) is generated the first time you open the app. It never leaves your device. All transaction signing happens locally — no keys are sent to any server, API, or third party. The bot submits signed transactions directly to the Solana blockchain.

2. PIN Encryption

Your private key is encrypted using AES-256-GCM before being stored on the device. The encryption key is derived from your PIN using PBKDF2 with 200,000 iterations of SHA-256 — the same standard used by password managers and banking apps. Without your PIN, the stored data is useless to anyone who accesses your phone.

- PIN is 6 digits, entered on app open
- Wrong PIN = no access, no decryption
- The PIN itself is never stored — only used to derive the encryption key

3. Biometric Unlock

After setting your PIN you will be offered fingerprint / face unlock. Your PIN is stored in the Android Keystore system (hardware-backed on modern devices) and is only retrievable after a successful biometric match. This means each subsequent app open can be unlocked with your fingerprint instead of typing the PIN.

4. ADB Backup Disabled

Android's backup system (which could allow extraction of app data via a USB cable) is explicitly disabled. Even with physical access to your phone and a computer, the encrypted wallet data cannot be copied out via standard Android tools.

5. Session Timeout

If the app is backgrounded for more than 5 minutes, the decryption key is cleared from memory. When you return, you must re-authenticate with PIN or biometric. The bot continues trading in the background — only the UI is locked.

& Back up your bot wallet address and make note of your PIN. If you uninstall the app or factory reset your phone, funds in the bot wallet are only recoverable if you have the private key — which in this version is device-only.

Installation

Requirements

- Android phone running Android 7.0 (API 24) or higher
- Fingerprint or face unlock set up on your phone (recommended)
- A Phantom wallet or any Solana wallet to fund the bot wallet
- Some SOL to commit (minimum 0.1 SOL recommended, 0.25–0.5 SOL ideal)

Step 1 — Allow installation from unknown sources

JiJ Bot is distributed as an APK file, not through the Google Play Store. You need to allow your phone to install apps from outside the Play Store.

1. Open Settings on your phone
2. Go to Apps (or Application Manager) !' Special app access !' Install unknown apps
3. Find your browser or file manager and toggle "Allow from this source" ON
4. This setting only applies to that one app — it does not permanently lower your security

Step 2 — Download the APK

Open the link below on your phone's browser and tap Download:

[[DOWNLOAD LINK](#)]

The file is named `app-release.apk` and is approximately 11 MB.

Step 3 — Install

1. Open your Downloads folder and tap `app-release.apk`
2. Tap Install on the confirmation screen
3. Tap Done (do not tap Open yet)

Step 4 — First launch & PIN setup

1. Open JiJ Bot from your app drawer — look for the robot lumberjack icon
2. You will be prompted to create a 6-digit PIN — choose something you will remember
3. Enter it again to confirm
4. You will be offered biometric unlock — tap Enable Biometric (recommended)
5. The app will generate your bot wallet and take you to the setup screen

Step 5 — Fund your bot wallet

1. On the setup screen, copy your Bot Wallet Address
2. Open Phantom (or any Solana wallet) and send SOL to that address
3. Tap Refresh Balance in the app until your balance shows
4. Enter how much SOL you want to commit to the grid bot
5. Set your daily DCA limit in USD
6. Tap Start Bot

The bot will immediately execute a seed buy (30% of your committed SOL buys JiJ), then place all grid orders. You will see live price, grid levels, and P&L on the dashboard.

Dashboard & FAQ

Reading the dashboard

- JiJ Price — live price in SOL and USD, updated every 30 seconds
- SOL Balance — current SOL in your bot wallet
- Grid Reserve — SOL remaining to fund buy orders
- Trail Buffer — a 15% safety reserve held back from grid orders
- Realised P&L — profit captured from completed grid cycles
- DCA toggle — switch DCA ON / OFF / Deactivated
- Stop Bot — gracefully stops the bot (keeps funds in wallet)
- Emergency Stop — immediately cancels all orders and stops
- + Top Up — add more SOL to the running bot (applies the same 70/30 split)

Frequently asked questions

Can I run the bot on both my phone and a desktop browser at the same time?

Yes. Each instance generates its own unique wallet, so they operate completely independently. Space the starts a few days apart so they begin at different price points, giving you different grid entry levels.

What happens if I close the app?

The bot saves its full state. When you reopen the app and authenticate, it resumes immediately — checking for any missed orders and restarting the polling loop.

What happens if the price goes outside the $\pm 40\%$ range?

The grid pauses at its outermost level. If price returns within range, trading resumes automatically. No funds are lost — orders simply aren't filled while price is outside the grid.

How do I withdraw my SOL?

Stop the bot first, then on the setup screen use Withdraw SOL back to Phantom — enter your Phantom address and the bot wallet sends everything minus a small gas fee.

Is this app open source?

The bot is built for the JiJ community. Source code availability will be announced in the community channels.

Download

The latest version of JiJ Bot for Android is always available at:
